

Mohme 28, Number I

# UPDATE ON THE REGAL FRITILLARY IN WISCONSIN

spectacular Regal he Fritillary (Speyeria idalia) was listed in Wisconsin as threatened in 1989 and endangered in 1997. My husband, Scott Swengel, and I have surveyed Regal populations here each year since 1990. We also conducted a companion study in five other states (Illinois, Iowa, Minnesota, Missouri, and North Dakota) from 1990 through 1999. In the latter three states, many large Regal populations occurred, allowing us to learn more quickly (or at all) many interesting relationships to habitat character-

istics and management that would be very difficult to demonstrate only with the few populations in Wisconsin.

From our surveys, others' reports (published in this newsletter), informal tips, and the DNR's statewide status survey in 1993 and 1994, the Regal Fritillary was known to exist

during the 1990s as a population (multiple individuals seen in the site on multiple dates) at only six sites or clusters of sites: Buena Vista (Portage County), Hogback (Crawford), Muralt/Oliver\* by Ann Swengel

(Green), Pine Island\* (Columbia), Thomson/Barneveld (Iowa), and Waterfowl Production Area(s)\* (St. Croix). Only the three starred areas have records known from before the 1990s, and the three largest known populations today do not have records from before the 1990s. It's all but impossible to piece together the very long-term picture of the Regal's distribution and trend in Wisconsin. If even half the effort in the 1990s to find and publish Regal records had occurred in earlier decades. how many more populations would have been found

then? We'll never know. But we can use what we know now to help improve the future outlook for this species in our state.

We started surveys at Muralt and Oliver in 1990, as well as at the first tract acquired at the Thomson preserve ("site 1"), where we discovered the first Regal for this area. Unfortunately, another initial research finding was

the disappearance of the population at Spring Green. In 1992, we started surveys at Hogback and the later land acquisition at Thomson ("site 2"), after others discovered Regal

populations in these places. We started surveys at Pine Island in 1993 but found no Regals until 1995, when we recorded populations at two sites.

In 1997, Scott was determined to search for Regals at Buena Vista. It has the factors most strongly associated with higher Regal numbers in our multi-state study (very large grassland size, presence of wetter and drier grassland types, and unintensive management by light grazing and/or having, with any burning in small, scattered, and infrequent fires). My ornithologist husband also noticed that sites with larger Regal populations also had better bird-watching, and Buena Vista has an outstanding avian community. Still, I thought he was crazy to expect Regals there, because Regals are prairie butterflies. should have trusted my own analyses! Poetically, I found the first Regal-a feeling I will treasure for the rest of my life. Apparently, Regals Please see, Regals, Page 2

The Wisconsin Entomological Society Newsletter is published three times a year, at irregular intervals. It is provided to encourage and facilitate the exchange of information by the membership, and to keep the members informed of the activities of the organization. Members are strongly encouraged to contribute items for inclusion in the newsletter. Please send all news items, notes, new or interesting insect records, season summaries, and research requests to the editor:

# 2001 Dues Notice!

**Th** collection envelope is Aenclosed with this newsletter, for the convenience of members who haven't paid their dues for 2001, No envelope is provided if you are paid up for 2001 or beyond. Please check the address label on this newsletter for your current dues status. Send check to our treasurer, Tom Rocheleau, 3100 Buena Vista St., Madison, WI 53704. Also appearing after your name will be your membership category (Individual, Family, Sustaining, or Patron). Be sure to notify us of any address changes when you send in your check or you may notify Les Ferge (address given at the bottom of page 1). V

#### Regals, from Page 1

define prairie somewhat differently than humans do. Meanwhile, Jim Margenau and his students re-discovered Regals in St. Croix County at large but certainly not pristine grasslands. The figure shows the highest survey counts of Regals at each site still supporting a Regal population that we've monitored for at least four years. We used the same survey route each year (except we expanded the route at Pine Island when we found Regals there). All surveys occurred with no rain, and either a minimum temperature of 68°F or a minimum of 20% sunshine with a minimum temperature of 60°F. We surveyed sites several times each flight period, but couldn't do weekly surveys at each site (which would ensure hitting near peak numbers) because we had other things to do (like work) and too many sites to check, at least in minimally acceptable weather. So we aimed to survey each site in the main flight period, not specifically peak, since it's hard to know exactly when peak is until after it's passed.

But we've mostly come fairly close to peak anyway. For 90% of the populations in the figure (i.e., each site in each year), a survey occurred within seven days before or after the date on which we observed the most Regals anywhere in the state (i.e., our observed peak date). In the other 10%, surveys occurred within 11 days before to 15 days after the peak date. Since about 3 weeks (or more) typically pass between first Regal adult and peak week, and then usually about 4-5 (or more) weeks after that to last adult, Numbers are high for a fairly broad period of 1-2 weeks before and after peak week.

The most obvious thing about the graph is how tangled and erratic the lines are. Some of this is due to the vagaries of when we got our highest count relative to weather and flight period timing at a given site. But a lot of this looks like the abundance fluctuations discussed so much by the British, from their widespread long-term butterfly surveying. The bar graph imbedded amongst the lines for individual sites shows the average number of Regals recorded at the four sites surveyed each year from 1992 to 2000.

Unfortunately, considerable population decline occurred at Muralt, where the entire habitat has been rotationally burned since the 1970s, with about 10-40% burned

Please check in at the information desk on the main concourse. Anyone who wishes to visit the collections or borrow material should contact the appropriate curator in advance: Lepidoptera-Carla Penz: email flea@mpm.edu, 414-278-6936; Other Insects-Gary Noonan: email carabid@mpm. edu, 414-278-2758; Non-insect Invertebrates-Joan Jass: email jass@mpm.edu, 414-278-2761. The meeting will include an overview and tour of the Puelicher Butterfly Garden, as well as election of officers. Please forward nominations to Phil Pellitteri: email pellitte@ entomology.wisc.edu, 608-262-6510. 📽

per year during our study period, except for no fires in 1990, 1993, 1998, and 2000. Our highest survey totals occurred in 1990 and 1993, with very low numbers from 1997 to 1999, but an encouraging (if small) increase in 2000. I didn't graph Oliver, where Bob Borth reported a consistent population in this newsletter in 1992, because we found 1-4 individuals on five dates in 1991. 1993, and 1994, and none since (1995-2000). This tiny prairie near Muralt was entirely burned in 1989, 1992, 1997, and 2000. I also left out Pine Island (site 2), where we recorded a population in 1995 and 1996 but no Regals in summer 1997-2000, following fires that burned this entire habitat in spring 1997 and again in 1998. A population still occurs, but is small and precarious, at Pine Island (site 1), which has recently been entirely burned over with partial fires in 1995, 1997, and 1999. Over the years, we have communicated with the owning agencies and managers of these sites, and remain hopeful for wider implementation of the excellent Regal management information Please see. Regals, Page 5

## **2000 PHOTO SALON WINNERS**

Pandorus Sphinx Moth Larva (Eumorpha pandorus) FIRST PLACE Janice Stiefel, Bailey's Harbor, WI—Photographed 8/31/00 Found on Wild Grape by Scott Randall in Glenbeulah, WI

Unidentified Cupmoth Larva <u>SECOND PLACE</u> Gene Drecktrah, Oshkosh, WI Photographed: 1980 Montrose, Australia

Pygmy Snaketail (Ophiogomphus howei) HONORABLE MENTION Karl Legler, Sauk City, WI Photographed: 6/00 Burnett Co. Threatened Species in Wisconsin

The Herald Moth (Scollopteryx libatrix) <u>HONORABLE MENTION</u> Janice Stiefel, Bailey's Harbor, WI Photographed: 7/31/00 Door Co.

White-Marked Tussock Larvae (Orgyia leucostigma) <u>THIRD PLACE</u> Janice Stiefel, Bailey's Harbor, WI Photographed: 8/9/00; 36 days old

Columbia Silkmoth (Hyalophora columbia) FOURTH PLACE Janice Stiefel, Photographed: 6/6/00 Door Co. (First time recorded from Door County)

#### **Photo Notes:**

The White-Marked Tussock Moth Larvae were raised from an egg mass that was found in Elkhart Lake, WI 10/20/99. The eggs were thought to be those of the Gypsy Moth. Eggs were over-wintered in a refrigerator, brought out in early June 2000 and hatched on 7/4/00. The four tufts on the left larva are bright yellow, whereas the tufts on the right are bright white. Obviously their coloration is variable, even if they are siblings.

The Pandorus Sphinx larva was transported from Glenbeulah (Sheboygan Co.) to Bailey's Harbor (Door Co.) by WES members, Therese & Scott Randall. They felt it was worth a 3 hr. trip, just to be photographed. The color is a brilliant rust-orange. Note how the small black spiracles (breathing holes) are ringed by cream-colored circles; except for the one at the rear.  $\Im$

# **One Day in May**

by Anita Carpenter

Finally, a sunny day in May coincided with a day off work so I coaxed my husband, Jerry, into making our annual pilgrimage to the Necedah National Wildlife Refuge in Central Wisconsin. I wanted to renew my acquaintance with spring in the central sands region and to see what butterflies were flying.

We arrived about 10:30 A.M. While Jerry stayed near the car, I walked along the road. Blue spikes of Wild Lupine were in full bloom, as were the lavender blossoms of the earth-hugging Bird's-Foot Violet. The easily-overlooked Rock Cress, with its diminutive, four-petaled white flowers, were everywhere. Scattered clumps of Yellow Puccoons punctuated the greening landscape. A little flock of Black-Capped Chickadees flitted and chitted about the oaks. But where were the butterflies? I strolled for half a mile. Not a butterfly, not an insect, was to be found. I thought: "This is really strange. I've always observed butterflies here. Perhaps we should travel to some other place to try to find some."

Then the atmosphere began to take on a weird feeling. The light began to fade. A solar eclipse was underway! I had forgotten all about it. I grabbed two pieces of paper and poked a pinhole in one to let the fading sunlight shine through onto the second sheet so that the image of the moon crossing the sun was visible. I looked around and realized that I didn't need paper. Thousands upon thousands of identical images were projected through minute holes in tree leaves onto the road, tree trunks, other leaves, and the car.

As the moon cast its darkening shadow upon the earth, the remaining daylight became more eerie and surreal. It was now twilight at noon. One could understand how ancient peoples might think the world was coming to an end. Nothing stirred-not a bird, not a tree leaf, not a whisper of wind. We ate lunch in a strange half-light.

After about 11/2 hours, the moon reached its maximum coverage of the sun and moved off to the right. The Photos: Anita Carpenter, Necedah National Wildlife Refuge, 5/10/94

daylight grew brighter. By now, we decided that it was too late to go some-

where else. If

**Eastern Pine Elfin** (Callophrys niphon)

nothing else happened, we had enjoyed the eclipse, scenery and solitude.

I walked along the road again. Although daylight seemed back to normal, still nothing moved. Then, as if on cue, nature's music makers broke the silence. Northern Leopard

Frogs croaked, trying to out-duel trilling American Toads. Rose-Breasted Grosbeaks broke into song as did the Robins. Bluebirds bubbled, Yellow Warblers lilted, Baltimore Orioles chortled. Least Flycatchers "che-becked,' Downy Wood peckers chipped, Song Sparrows warbled, and

Henry's Elfin (Callophrys henrici)

Chickadees "chick-a-dee-deed." Song surrounded me. I was listening to dawn's avian chorus at 1:30 P.M.! I had never heard so much joyous bird sound in the early afternoon before. It lasted about fifteen minutes, then tapered off.

A slithering Eastern Garter Snake stirred the dry oak leaves. Instantly, as if the theory of

Brown Elfin (Callophrys augustinus)

spontaneous generation was for real, butterflies were everywhere basking on the sandy, dirt road. They were so abundant I didn't know which one to look at or photograph first. Identifying the tattered American Ladies was easy but, oh, those Duskywings. Several male and female Juvenal Duskywings basked, as did a

smaller male Persius Duskywing. A few Spring Azures laterally basked, soaking up the warmth as did three Elfin species. I had seen Eastern Pine Elfins here before, so they weren't unexpected but today the Brown Elfin was a surprise. And to top that, a short time later, I saw my

> first and, to date, my only Henry's Elfin. It was so cooperative it even perched on my index finger and posed for a picture. Several white with green-veined Olympia Marbles nectared on Rock Cress as did one Mustard White. Butterfly activity was intense for about an hour. I was running back

and forth on this fifty meter stretch of road, chasing butterflies. I was in heaven. This was glorious.

Dragonflies darted about. One landed nearby. I took its picture. Time flew. I did not want to leave the refuge that day. I felt that I had experienced something special. If I hadn't witnessed it for myself, I Please see, One Day in May, Page 5

2000 WISCONSIN LEPIDOPTERA SEASON SUMMARY Coordinator: Leslie A. Ferge

s in the previous two years, the 2000 season began early RJB following a mild winter, JAE phenologically not as early as 1998 but CBF earlier than 1999. Ferge documented LAF early records of several species of JCP hibernating Noctuidae (Eupsilia and TR Lithophane species) on 25 February in MS Rock County, found spring emerging Noctuidae and Geometridae in early SAS March in Jackson County, but experienced a slowdown due to cold

conditions in May. Summer temperatures were unremarkable, but rainy conditions were prevalent in some areas. The season lasted well into fall, with mild periods allowing moth activity to persist into early November. Sabourin noted a generally mild season in northwestern Wisconsin, but not as humid as the past three years. The Swengels reported a good season for migrants, but not as good as 1999. They reported *Junonia coenia* in many sites, with the first sighting in Sauk County on 7 May. *Euptoieta claudia* was seen in Burnett, Crawford, Jackson, Portage and Sauk Counties, from early June through August. *Strymon melinus* and

## One Day in May, from Page 4

never would have imagined the profound effect a solar eclipse has on nature. The "false night" with its eerie stillness had triggered the "false dawn" with its incredible burst of song and activity. From its quiet, inauspicious beginning to its unbelievable conclusion, this one day in May was extraordinary. It has been the most memorable day I've spent in the field.

But the excitement of "the day of the solar eclipse" was to resurface four years later. Remember the picture of that dragonfly? I was just beginning to study and identify dragonflies, so just by pure serendipity, I had taken this one's picture. I couldn't identify the individual and cataloged the slide as "unidentified." I had no idea that that photograph would eventually become the first recorded documentation for a newly discovered, early-flying dragonfly species in Wisconsin. The species, which was subsequently discovered and identified by Karl Legler, was the Ringed Bog Haunter (Williamsonia lintneri). I couldn't believe my luck. I had been in the right place, at the right time, under the right conditions. What a day! ඊ

Anita, a WES member, is a pharmacist in Oshkosh, WI. But her real passion is nature. She explores, photographs, writes, and speaks on the subject. For 20 years she has written her "Badger Tracks" nature column in the local Audubon chapter newsletter is a regular contributor to Wisconsin Natural Resources Magazine---writing on everything from atmospheric optical phenomena to insects.

#### Regals, from Page 2

described in the Bureau of Endangered Resources' June 1999 report (PUB-ER-085-99), "The Endangered and Threatened Invertebrates of Wisconsin." The DNR has shown increased interest in developing management protocols appropriate for rare butterflies, which will be good news for butterflies where implemented.

Results are hopeful at the larger populations. At Thomson 2, half the site was burned in spring 1992, with steadily decreasing areas burned in 1995 and 1997, and the smallest fire in 1996. While the 1995 fire reduced the never-burned area to about 30% of the habitat, this area (where we record most of the Regals) has not decreased further since. Increased Regal numbers at this site also appear

Eurema lisa were also reported from several localities, extending into central Wisconsin. Monarchs were seen from 15 May through 1 November, arriving as early as last year but persisting a bit later. A significant number of stray or migrant moth species were collected, including Tetanolita mynesalis, Anticarsia gemmatalis, Ctenoplusia oxygramma, Magusa orbifera, Euxoa auxiliaris, Condica sutor and Agrotis subterranea, the latter two being new

state records taken at bait in early November. The records are arranged systematically by checklist number, following the Checklist of the Lepidoptera of America North of Mexico (Hodges et al., 1983). New county records are indicated by county names appearing in CAPITAL letters. Abbreviations used in the data include:

CF=County Forest SF=State Forest

Forest NWR=National Wildlife Refuge orest SFA=State Fishery Area SNA=State Natural Area

SUMMARY begins on Page 6

associated with areas of brush clearance, done by dedicated volunteers. Hogback has had a relatively large population both when it was private farmland with light cattle grazing and after grazing removal upon becoming a Nature Conservancy preserve. Brush cutting but no burning has since occurred (through summer 2000). In recent years, the Nature Conservancy has invested considerable resources in Regal surveys and an evolving approach to habitat management. Most heartening is the widespread distribution and areas of localized abundance of Regals at Buena Vista. Since 1992, only about 5% of this site was burned per year in scattered patches, while about 7% per year was cattle grazed, and lesser amounts subject to having and brush control. The patterns of Regal numbers relative to site management in our Wisconsin surveys are consistent with our studies elsewhere and with the BER report. T

Ann is vice-president of the North American Butterfly Association (NABA) and a member of WES. She and her husband, Scott, enthusiastically survey butterflies and have published a number of scientific papers on their observations.

## The SECRET of the Color RED

by Janice Stiefel

When Cortes enter into Mexico In the year of fifteen nineteen, He noticed something that, heretofore, Had never, ever been seen.

It was an exquisite shade of color They called it "brilliant red." T'was used on the soldiers' shields And in their fabric thread.

Cortes asked many questions, Searching for their secret dye. Then he discovered bags of powder, Soon after he became a spy.

Sending the bags on a boat to Spain Was his eventual and sneaky plan. Ladies would want it for their clothes, As well as each and every man.

Catholic Cardinals sought the color, too; For the long robes they wore. Michelangelo used it in paintings Everyone wanted it more and more. In seventeen hundred, a Dutch scientist Observed with his new microscope That the powdered substance in the bags Contained tiny LEGS—there was hope!

Since the dye was always exported From a "secret Mexican farm," It would take some tricky adventurers Using their wily ways and charm.

They found fields of large cacti, Called "*Prickly Pear*," to be exact, Each was covered with tiny insects Like mealybugs, as a matter-of-fact.

The insects were black, red and wingless About the size of a match's head. <u>THEY</u> were the long-sought secret— The marvelous news then spread.

Making the dye was quite tedious; Insects had to be captured and dried. Only the females contained the pigment, So the males were tossed aside.

Rollers were used by the women. Each bug was actually stone-ground. It took seventy-thousand insect bodies Just to make a single pound.

For more than three centuries This tiny insect was in demand, Using it for sausage, medicine and food, Anything red—throughout every land.

With eighteen hundred came synthetics To ease the demand a small bit. Today, it's used in make-up and paint, And for photography it has always fit.

Thanks to those tiny insects with legs And the Mexican Prickly Pear Our lives are illumined with color— "Brilliant" red for us to use with flair!

© 1992 Janice Stiefel

According to the Wisconsin Plant Checklist, there are three species of Prickly Pear Cacti found in Wisconsin, while the tropics play host to many more. The species used for dye purposes was probably the Cochineal Insect Cactus (Opuntia cochinellifera), which is a native of Mexico, now cultivated in the West Indies and other places, as well.
